

What the Ayurvedic Formulary of India's ingredient names mean

The formulary names its ingredients in Sanskrit and does not use one name per drug. Across the 101 entries transcribed here, **1,973 ingredient rows use 638 distinct spellings**. *Abhaya* and *Pathya* are both haritaki. *Nagara* is sunthi. *Marica* is black pepper. This resolves each name to a botanical identity where one could be established, and says plainly where one could not.

Licence: CC BY 4.0. The ingredient names and the glosses beside them are the Ayurvedic Formulary of India's own text, transcribed and cited to part and entry number. The resolutions and the basis statements are this project's work.

Built: from the same file the web page renders, so the two cannot disagree.

What is here

Ingredient rows covered	1,973, across 101 formulary entries
Distinct names	638
Resolved to a botanical identity	461 names, 1,584 rows
Of the plant rows	1,524 of 1,761
Resolved by a gloss the book itself prints	542 rows
Used for more than one drug	17 names, published as ambiguous rather than collapsed
Unresolved	160 names, published as unresolved rather than guessed

How a name was resolved

The strongest evidence is the formulary's own: it prints a gloss against an ingredient on 722 rows, so where it says *Abhaya* (*haritaki*) that is the book telling you which drug it means. Those glosses are used per row and never chained, because a gloss is true of the row it is printed on: an early version of this work chained them and produced *Madhuka* = *Madhu* = *Maksika* resolved to arjuna, merging liquorice, honey and a mineral calcine across 47 rows.

Otherwise a name is matched against the herb monographs published on the site, which carry GBIF-resolved binomials. An exact name match wins outright and an approximate one is flagged: 648 rows rest on an approximate match. *Pippali* is *Piper longum* and *Pippala* is *Ficus religiosa*, one vowel apart and unrelated, and a matcher built for product names called the most-used ingredient in the formulary a sacred fig across 40 rows before exact matches were made to win.

Names the formulary uses for more than one drug

Reported rather than resolved. A crosswalk that silently picked one reading would be wrong a predictable share of the time while looking complete.

Name	Rows	Resolves to
Candana	13	<i>Santalum album</i> (8) · <i>Pterocarpus santalinus</i> (5)

Name	Rows	Resolves to

Visa - suddha	1	<i>Aconitum ferox</i>
Visa (vatsanabha)-suddha	1	<i>Aconitum ferox</i>
Visvabhesaja (sunthi)	1	<i>Zingiber officinale</i>
Visvahva	1	<i>Zingiber officinale</i>
Visvausadha	1	<i>Zingiber officinale</i>
Vrsamula (vasa)	1	<i>Adhatoda vasica</i>
Vrsciraka	1	<i>Boerhaavia diffusa</i>
Vyaghri	1	<i>Solanum</i>
Water for soaking and for preparation of arka	1	<i>Calotropis procera</i>
Yamani (yavani)	1	<i>Trachyspermum ammi</i>
Yamanika (yavani)	1	<i>Trachyspermum ammi</i>
Yasti madhu	1	<i>Glycyrrhiza glabra</i>
Yavagraja	1	<i>Hordeum vulgare</i>
Yavasa	1	<i>Alhagi pseudalhagi</i>

What is still unresolved

160 names, 115 of them plant drugs this project holds no monograph for, and the rest vehicles, sweeteners, salts, fats and mineral preparations that have no botanical identity to resolve. They are listed so the gap is visible and someone can close it with a source.
